

St. Thomas' College of Engineering and Technology

Detailed Institutional Context for a College Information / RAG Knowledge Base

1. Institutional Overview

St. Thomas' College of Engineering and Technology (STCET) is an engineering and technology institution located in Kolkata, West Bengal, India. The college is commonly referred to as STCET and is associated with undergraduate and postgraduate education in engineering, technology, computer applications and related disciplines. Its academic environment combines classroom learning, laboratory work, technical projects, student activities and industry-oriented preparation.

The college is located in the Kidderpore/Khidderpore area of Kolkata. Its urban location places students within access of Kolkata's broader educational, industrial and technology ecosystem.

2. Academic Structure

STCET offers engineering-focused academic programs through different departments. Students typically progress through a semester-based curriculum consisting of theory subjects, laboratory courses, practical or sessional components, projects, examinations and other academic requirements.

Area	Typical academic components
Engineering education	Theory courses, laboratories, tutorials and practical work
Computer/AI-related study	Programming, databases, algorithms, machine learning, software development and related subjects
Projects	Mini-projects, major/final-year projects, technical prototypes and applied problem solving
Assessment	Internal assessment, practical/sessional work, semester examinations and project evaluation
Professional development	Technical events, hackathons, seminars, internships, placements and industry interaction

3. Student Life and Campus Activities

Student life at an engineering college such as STCET extends beyond formal coursework. Students may participate in technical clubs, coding activities, cultural programs, sports, seminars, workshops, hackathons, project exhibitions and student-led events. These activities provide opportunities to develop communication, teamwork, leadership and practical engineering skills.

4. Technology and Innovation

Technology-focused students can build practical skills through programming, software development, artificial intelligence and machine learning, data science, cloud computing, cybersecurity, electronics, IoT and other engineering domains. Projects and hackathons can serve as a bridge between academic concepts and real-world problem solving.

A typical technical project workflow can include identifying a problem, collecting or preparing data, selecting appropriate technologies, implementing a prototype, testing the system, documenting the results and presenting the final solution.

5. Placements and Career Preparation

Career preparation at an engineering college commonly includes aptitude preparation, coding practice, technical interviews, communication rounds, resume development, project discussions and HR interviews. Students may prepare for software engineering, IT services, consulting, analytics, engineering and other technology-oriented roles depending on eligibility and recruiter requirements.

Students should always verify current placement eligibility criteria, recruiter lists, compensation details, dates and selection processes through official college placement communications because these details can change from one recruitment cycle to another.

6. Common Student Information Categories

Category	Examples of information useful in a college knowledge base
Admissions	Programs, eligibility, application process, admission requirements and important dates
Academics	Departments, subjects, semesters, examinations, attendance and academic regulations
Departments	Department descriptions, faculty information, laboratories and academic programs
Placements	Eligibility, recruitment process, preparation guidance, recruiters and placement-related notices
Student activities	Clubs, events, hackathons, workshops, cultural and technical activities
Facilities	Library, laboratories, classrooms, computer facilities, campus services and student amenities
Administration	Office contacts, notices, academic calendars and institutional procedures

7. RAG Knowledge-Base Context

This document can be used as a starter knowledge source for a Retrieval-Augmented Generation (RAG) application. The document should be split into meaningful chunks before embedding. Each chunk can contain a clear topic such as admissions, academics, departments, placements or student activities.

Example user questions: What programs does STCET offer? What kind of academic assessment is used? What should a student prepare for placements? What technical activities can students participate in? Where is STCET located?

For a production RAG system, this starter context should be supplemented with verified official documents such as the current academic regulations, department pages, admission notices, examination notices, placement notices, academic calendars and official contact information.

8. Important Data-Quality Note

This PDF is intended as a structured starter context for experimentation and RAG development. It should not be treated as an authoritative source for current admission rules, fees, placement statistics, examination dates, contact details or other time-sensitive institutional information. Those details should be populated from current official STCET sources before deploying a student-facing assistant.

Prepared as a structured knowledge-base document for an educational RAG prototype.
